## The Editorial Policy for Monographs

The series Lecture Notes in Physics reports new developments in physical research and teaching - quickly, informally, and at a high level. The type of material considered for publication in the New Series m includes monographs presenting original research or new angles in a classical field. The timeliness of a manuscript is more important than its form, which may be preliminary or tentative. Manuscripts should be reasonably self-contained. They will often present not only results of the author(s) but also related work by other people and will provide sufficient motivation, examples, and applications.

The manuscripts or a detailed description thereof should be submitted either to one of the series editors or to the managing editor. The proposal is then carefully refereed. A final decision concerning publication can often only be made on the basis of the complete manuscript, but otherwise the editors will try to make a preliminary decision as definite as they can on the basis of the available information.

Manuscripts should be no less than 100 and preferably no more than 400 pages in length. Final manuscripts should preferably be in English, or possibly in French or German. They should include a table of contents and an informative introduction accessible also to readers not particularly familiar with the topic treated. Authors are free to use the material in other publications. However, if extensive use is made elsewhere, the publisher should be informed. Authors receive jointly 50 complimentary copies of their book. They are entitled to purchase further copies of their book at a reduced rate. As a rule no reprints of individual contributions can be supplied. No royalty is paid on Lecture Notes in Physics volumes. Commitment to publish is made by letter of interest rather than by signing a formal contract. Springer-Verlag secures the copyright for each volume.

## The Production Process

The books are hardbound, and quality paper appropriate to the needs of the author(s) is used. Publication time is about ten weeks. More than twenty years of experience guarantee authors the best possible service. To reach the goal of rapid publication at a low price the technique of photographic reproduction from a camera-ready manuscript was chosen. This process shifts the main responsibility for the technical quality considerably from the publisher to the author. We therefore urge all authors to observe very carefully our guidelines for the preparation of camera-ready manuscripts, which we will supply on request. This applies especially to the quality of figures and halftones submitted for publication. Figures should be submitted as originals or glossy prints, as very often Xerox copies are not suitable for reproduction. For the same reason, any writing within figures should not be smaller than 2.5 mm. It might be useful to look at some of the volumes already published or, especially if some atypical text is planned, to write to the Physics Editorial Department of Springer-Verlag direct. This avoids mistakes and time-consuming correspondence during the production period.

As a special service, we offer free of charge L<sup>A</sup>T<sub>E</sub>X and T<sub>E</sub>X macro packages to format the text according to Springer-Verlag's quality requirements. We strongly recommend authors to make use of this offer, as the result will be a book of considerably improved technical quality.

Manuscripts not meeting the technical standard of the series will have to be returned for improvement.

For further information please contact Springer-Verlag, Physics Editorial Department II, Tiergartenstrasse 17, D-69121 Heidelberg, Germany.

# Preface

The idea of this book originated from two series of lectures given by us at the Physics Department of the Catholic University of Petrópolis, in Brazil. Its aim is to present an introduction to the “algebraic” method in the perturbative renormalization of relativistic quantum field theory. Although this approach goes back to the pioneering works of Symanzik in the early 1970s and was systematized by Becchi, Rouet and Stora as early as 1972–1974, its full value has not yet been widely appreciated by the practitioners of quantum field theory. Becchi, Rouet and Stora have, however, shown it to be a powerful tool for proving the renormalizability of theories with (broken) symmetries and of gauge theories. We have thus found it pertinent to collect in a self-contained manner the available information on algebraic renormalization, which was previously scattered in many original papers and in a few older review articles.

Although we have taken care to adapt the level of this book to that of a post-graduate (Ph.D.) course, more advanced researchers will also certainly find it useful.

The deeper knowledge of renormalization theory we hope readers will acquire should help them to face the difficult problems of quantum field theory. It should also be very helpful to the more phenomenology oriented readers who want to familiarize themselves with the formalism of renormalization theory, a necessity in view of the sophisticated perturbative calculations currently being done, in particular in the standard model of particle interactions.

*Acknowledgements.* We particularly thank Profs. Renato M. Doria and José Helayel Neto for their very kind invitations to Petrópolis and the students who had the patience to hear our courses and encouraged us by their pertinent questions.

We wish to express our gratitude to C. Becchi, A. Blasi, R. Collina, F. Delduc, R.M. Doria, S. Emery, F. Gieres, E. Guadagnini, J. Helayel Neto, C. Lucchesi, N. Maggiore, F.A.B. Rabelo de Carvalho, M. Schweda, K. Sibold, C. Stafford, R. Stora, M. Werneck de Oliveira, J. Wess and S. Wolf, as well as to all our colleagues in the physics departments of the Universities of Geneva and Vienna, and at the Centro Brasileiro Pesquisas Físicas (CBPF) in Rio de Janeiro, some of them for fruitful collaborations and all of them for many helpful discussions on the various aspects of the material presented here.

This book was made possible thanks to the generous financial support of the Conselho Nacional de Pesquisa e Desenvolvimento (CNPq, Brazil), the Austrian Science Foundation, the Ausseninstitut of the Technical University of Vienna and the Swiss National Science Foundation.

# Table of Contents

1	Introduction . . . . .	1
2	Renormalized Perturbation Theory . . . . .	3
2.1	Generating Functionals . . . . .	4
2.1.1	The Green Functional . . . . .	4
2.1.2	The Connected and the Vertex Functionals . . . . .	6
2.1.3	Expansion in $\hbar$ . . . . .	7
2.1.4	Composite Fields . . . . .	7
2.2	Renormalization . . . . .	9
2.2.1	Ultraviolet Divergences . . . . .	9
2.2.2	Ultraviolet Subtractions . . . . .	11
2.2.3	Generalization to Higher Loop Graphs . . . . .	15
2.2.4	General Results . . . . .	16
2.2.5	Renormalizability and Nonrenormalizability . . . . .	17
2.2.6	Physical and Nonphysical Renormalizations . . . . .	18
2.2.7	The Role of Symmetry . . . . .	19
2.3	Asymptotic Behaviour . . . . .	20
3	Quantum Action Principle and Ward Identities . . . . .	21
3.1	Ward Identities in the Tree Approximation . . . . .	21
3.1.1	Linear Transformations . . . . .	22
3.1.2	Nonlinear Rigid Invariance: BRS Transformations . . . . .	23
3.2	The Quantum Action Principle . . . . .	24
3.3	Basis of Insertions . . . . .	26
3.4	A $U(1)$ Scalar Model . . . . .	27
3.4.1	Ward Identity . . . . .	27
3.4.2	The Callan–Symanzik Equation . . . . .	29
3.4.3	Renormalization Group Equation . . . . .	31
3.5	A $O(N)$ Scalar Model . . . . .	32
3.5.1	Ward Identities . . . . .	32
3.5.2	Solution of the Consistency Condition . . . . .	33
3.5.3	The Callan–Symanzik Equation . . . . .	34
3.6	Basis of Symmetric Insertions . . . . .	35
3.7	Summary of the Quantum Action Principle . . . . .	35

4	Yang–Mills Gauge Theories . . . . .	37
4.1	Tree Approximation, Gauge Fixing and BRS Invariance . . . . .	37
4.2	Renormalization: The Consistency Condition . . . . .	40
4.3	BRS Cohomology: The Gauge Anomaly . . . . .	45
4.3.1	Elimination of the External Field and Matter Field Dependence from the Anomaly . . . . .	46
4.3.2	The Gauge Anomaly and the Descent Equations . . . . .	47
4.4	Stability . . . . .	49
4.4.1	Invariant Counterterms . . . . .	49
4.4.2	Physical and Nonphysical Parameters . . . . .	50
4.4.3	The Callan–Symanzik Equation . . . . .	51
4.5	Gauge Independence of the Physical Operators . . . . .	52
4.6	Gauge Invariance Together with Rigid Invariance . . . . .	54
4.6.1	BRS Transformations . . . . .	54
4.6.2	Gauge Fixing . . . . .	56
4.6.3	Slavnov–Taylor Identity and Ward Identities . . . . .	56
5	BRS Cohomology and Descent Equations . . . . .	59
5.1	The Descent Equations: Definitions and Generalities . . . . .	59
5.1.1	Cohomology of $\delta$ Modulo $d$ and Cohomology of $\delta$ . . . . .	59
5.1.2	The General Strategy for Solving the Descent Equations . . . . .	61
5.2	Local Cohomologies . . . . .	62
5.2.1	Filtration . . . . .	62
5.2.2	BRS Doublets . . . . .	64
5.2.3	Restriction to a Subspace Constrained by a Rigid Symmetry . . . . .	65
5.2.4	Poincaré Lemma for $d$ . . . . .	66
5.3	General Solution of the Classical Descent Equations in Yang–Mills Theory . . . . .	67
5.3.1	The Descent Equations of the Gauge Anomaly . . . . .	67
5.3.2	General Results for Yang–Mills Theories in the Classical Approximation . . . . .	71
5.3.3	Local Cohomology of $s$ . . . . .	71
5.3.4	Local Cohomology of $s$ Modulo $d$ . The Russian Formula . . . . .	72
5.4	General Solution of the Classical Descent Equations in Topological Theory . . . . .	73
5.5	Renormalized Descent Equations in Yang–Mills Theory . . . . .	76
5.5.1	Renormalization . . . . .	76
5.5.2	The Callan–Symanzik Equation for the Ladder of the Gauge Anomaly . . . . .	78
6	Nonrenormalization Theorems . . . . .	81
6.1	The Antighost Equation . . . . .	81
6.1.1	Renormalization of the Antighost Equation . . . . .	83
6.2	Nonrenormalization Theorems . . . . .	85
6.2.1	Nonrenormalization of the Ghost Field . . . . .	85
6.2.2	Nonrenormalization of $\text{Tr } c^{(2p+1)}$ . . . . .	87
6.3	The Adler–Bardeen Theorem . . . . .	89
6.3.1	The Callan–Symanzik Equation for the Anomaly . . . . .	89
6.3.2	The Nonrenormalization Theorem of the Gauge Anomaly . . . . .	91

# 1. Introduction

Relativistic quantum field theory (RQFT) was introduced at the end of the 1920s in order to unify the principles of quantum mechanics and of special relativity (see for example the first of Dirac's papers in [1]). Since that time RQFT has been the object of ever increasing interest. Together with some of its extensions, such as string theory, it has now become our main conceptual framework for describing the fundamental structure of matter [2]. We underline, in particular, the well established and successful applications to the gauge theories of particle interactions: QED, the standard model, QCD and supersymmetric extensions thereof. Although a quantum theory of gravity has not yet been firmly formulated, there are now hopes for a consistent field theoretical description as well [3].

However, it has been realized since its beginnings (see [4] and Heisenberg's paper in [1]) that RQFT was plagued by an apparently insuperable difficulty, namely the problem of the ultraviolet (UV) divergences, which had forbidden any computation beyond the lowest order of perturbation theory. The origin of this difficulty lies in the occurrence of singular products of distributions at coinciding points in the computation of the higher-order terms [5, 6]. As is now well known, the search for a solution to the problem of the subtraction of the UV divergences, lasting from the 1940s to the 1970s, has led to the establishment of a consistent theoretical and mathematical framework called renormalization theory [1, 7, 8]. These efforts, rewarded first by the spectacular agreement of theory with experiment in QED [1, 9], culminated in the proof of the renormalizability of the nonabelian gauge theories [10, 11], which are the basis of our present understanding of high-energy physics.

At the beginning of the 1970s a few UV subtraction schemes were available and were proven to be equivalent [7]. It is a remarkable result that these schemes led to a renormalized perturbation theory whose properties can be collected in a set of rigorous statements, common to all of them. These statements, based on locality and power counting, constitute the content of the so-called quantum action principle (QAP) [12, 13, 14]. The latter is the starting point of any rigorous investigation in the framework of perturbation theory.

It was early recognized by Becchi, Rouet and Stora, in their works on the BRS invariance of gauge theories [15, 16] and on the models with broken rigid symmetries [17], that the use of the QAP leads to the possibility of a fully algebraic proof of the renormalizability of a theory characterized by a set of local or rigid invariances. Let us remark that we distinguish "renormalization", which for us means the implementation of the symmetries of a given classical model to all orders of perturbation series, from the mere "UV subtractions". The QAP actually allows one to control the breaking of a symmetry induced by a noninvariant subtraction scheme, helping then
